Pathophysiological causes of chronic tympanitic obstruction (ear block) in gray Sokol lambs and new observations on pregastric digestion in sheep. V. N. Nikitin, O. G. Tverdun, N. A. Lebedinskii, A. F. Loiko, and V. V. Mamina. *Zhur. Obshchei Biol. (J. Gen. Biol.)* 11, 330-394 (1970). Chronic tympanitic obstruction in sheep changes the microflora of the chyme, hence its fermentation behavior. Hemoglobin count and other characteristics also change. Differences in chyme acids indicate the possibility of better fattening by diet control.
Julius F. Smith

TITLE: A Frame for the Treatment of Viniplast Foil

PERIODICAL: Khimicheskiye volokna, 1960, Nr 1, p 67 (USSR)

TEXT: Viniplast foil is used in the synthetic fiber industry and other branches as an antirust coating for reservoirs, machine parts, etc. The sawing of the foil and the trimming before the welding of the seams has hitherto been done manually. The authors describe a new frame developed by them, which has a sliding table on which the clamped viniplast foil is cut by a side-milling cutter. The frame was designed by the EKB (Eksperimental'no-konstruktorskoye byuro - Experimental and Design Office) of the VNIIV and built by the eksperimental'nyy mekhanicheskiy tsekh (Mechanical Experimental Workshop). The operation of the frame in the antikorroziynny tsekh (Anticorrosion Workshop) of VNIIV showed a triple increase in its performance as compared to manual work. The frame is finally illustrated and described. There is 1 figure.

TITLE: Curculionidae in the Wild Woods of Trans-Carpathia
(Dolgonosiki, svyazannyye s dikoy drevesnoy rastitel'-
nost'yu Zakarpat'ya)

PERIODICAL: Nauch. zap. Uzhgorodsk. un-ta, 1956, Vol 16, pp 93-108

ABSTRACT: The article presents a listing of curculionidae found
in hazelnut, alder, hornbeam, oak, birch, beech,
willow, spruce, aspen, wild plum, dogwood, and wild
currant. The following types may be distinguished:
rare--(r), found in one or two places; isolated--(i),
found only once; usual--(u) found in many places; and
common--(c), found everywhere. Concentration of
curculionidae may also be classified on a five-stage
scale: 1) individual specimens; 2) a few specimens;

Card 1/2

14-57-6-12696

Curculionidae in the Wild Woods (Cont.)

3) many specimens; 4) very many specimens; 5) masses of specimens. The simultaneous occurrence of both factors in the spread of the species is one of its peculiarities; thus we may encounter at the same time r^2 , o^1 , etc. The article describes the vertical distribution of the species along different mountain belts, and its distribution in various types of trees.

in the Transcarpathian Region.

Orig Pub: Nauchn. zap. Uzhgorodsk. un-t, 1956, 16, 93-108.

Abstract: A list was given of species that were found in 1950-1953 on wood varieties (in all 91 species); the months when they were found, and the zones of their distribution were noted. Some species were found frequently and the density of their population on the plants was very large. Such species were: *Otiorhynchus multipunctatus* (which was found on hazelnut, alder, oak, white beech, birch, beech, willow, pine, maple, nut, black-

Eds.: Ye. M. Minskiy and V.N. Raaben; Exec. Ed.: M.P. Martynova; Tech. Ed.: A.S. Polosina.

PURPOSE: This collection of articles is intended for scientists, engineers, and technicians associated with the gas industry.

COVERAGE: The articles discuss the development of gas fields, natural gas recovery, gas transportation, and subsurface gas conservation. Gas field operating conditions are analyzed from the commercial point of view. The author notes that due to the specific geological conditions prevailing in the Soviet Union the application of gas extraction methods of the type used in the USA

is not always advantageous. Individual articles discuss problems of the development of gas fields with narrow oil containing fringes, the theory of gas inflow, the study of gas well performance, gas filtration dynamics, and the study of gas condensates. A number of articles are devoted to the study of unstabilized gas flow in pipelines, and discuss theoretical problems connected with the performance of gas ejectors and compressors. The authors also deal with corrosion of the inner surface of gas pipelines. Conclusions made by the authors are supported by mathematical calculations. No personalities are mentioned. References accompany each article.

TITLE: Corpuscular radiation in equatorial regions at low altitudes

SOURCE: Vsesoyuznaya konferentsiya po fizike kosmicheskogo prostranstva. Moscow, 1965, Issledovaniya kosmicheskogo prostranstva (Space research); trudy konferentsii. Moscow, Izd-vo Nauka, 1965, 465-466

TOPIC TAGS: electron flux, magnetic anomaly, cosmic ray, albedo

ABSTRACT: It is assumed that the intensity of electron flux at low altitudes (300-400 km) in equatorial regions is due to neutron decay in the albedo of cosmic rays. Electrons were captured at different heights. By knowing the latitude and the pitch angle (for known longitude), it is possible to compute the rate of accumulation. It was found that each energy value of electron corresponds to a definite height. Computations of expected intensities of electron flux are shown in Table 1 of the Enclosure. The intensity on ascending branches of the drift orbit is small, since electrons quickly move upward from any given height. The greatest intensity may be expected over the Pacific Ocean and over South America

AUTHOR: Tverskaya, L. V.

TITLE: The influence of elastic-relaxation stresses on the crystallization of highly viscous liquids

PERIODICAL: Doklady Akademii nauk SSSR, v. 137, no. 5, 1961, 1095-1097

TEXT: It is known that in amorphous media the elastic stresses die out within a certain relaxation time. Therefore the elastic stresses influence the growth of a crystal only for a short time (τ). The relation between the time τ and the time τ_0 required by an atom for the transition from the liquid to the solid state is normally such that $\tau \sim n^2 \tau_0$. For highly viscous liquids $\tau > 10 \tau_0$. In the present paper it is assumed that the crystal grows spherically and the stress on the boundary of the surface of the crystal is as that produced during growth due to the change in the density: $\sigma_{rr}(R) = -\delta p$. In the presence of such a stress the temperature of the crystal decreases during growth in

Card 1/5

21971

S/020/61/137/005/014/026
B104/B214

The influence of elastic-relaxation ...

agreement with the Clausius-Clapeyron equation. If the crystallization is carried out at a temperature T_1 , a crystal of radius R is in equilibrium

with the medium when $\sigma_{rr}(R) = \left(\frac{T_0 - T_1}{T_0} q \rho_2 - 2\alpha/R \right) \frac{1}{3\beta} \equiv \sigma_{rr}^{(0)}$ (1).

Here, T_0 is the melting point of the undeformed surface, q the heat of transition per gram, α the coefficient of surface stress, and 3β the relative change in density on crystallization. If

$\sigma_{rr}(R) > \sigma_{rr}^{(0)}$, the crystal melts. If $\sigma_{rr}(R) < \sigma_{rr}^{(0)}$, the crystal grows, the characteristic time of the processes being τ_0 . Under definite

conditions Eq. (1) may be fulfilled. Then the growth of the crystal is subjected to relaxation stresses. The growth of a crystal subjected to the above processes is investigated, (1) being calculated from the boundary conditions. It is assumed that Hook's law is obeyed in the crystal and the elastic relaxation stresses appearing in the amorphous phase are given by an interpolation formula for highly viscous liquids. Then the equation obtained for the growth of the crystal is:

Card 2/5

The influence of elastic-relaxation ...

21971

S/020/61/137/005/014/026

B104/B214

таким образом, из уравнения (9) следует:

$$\left(\frac{1+\sigma_1}{2E_1} + \frac{1-2\sigma_2}{E_2}\right) \frac{d}{dt} R^3 \left(\frac{T_0-T_1}{T_0} q\rho_2 R - 2\alpha\right) + \frac{1}{\tau} R^3 \frac{1+\sigma_1}{2E_1} \left(\frac{T_0-T_1}{T_0} q\rho_2 R - 2\alpha\right) = 3\beta^2 R^2 \frac{dR}{dt}. \quad (9)$$

The indices 1 and 2 refer to the different phases. For the initial condition $R_{t=0} = R_1$, Eq. (9) has the following solution:

For the initial condition

$$R \left(\frac{R-R_0}{R_1-R_0}\right)^v = R_1 e^{-t/\tau_1}, \quad (10)$$

where

$$R_0 = \frac{2\alpha T_0}{(T_0-T_1) q\rho_2} \text{ (критический размер зародыша);}$$

$$v = \frac{1}{2} \left(1 - \frac{3\beta^2 E_1 E_2 T_0}{q\rho_2 (T_0-T_1) [(1+\sigma_1) E_2 + (1-2\sigma_2) E_1]}\right),$$

$$\tau_1 = 2\tau \left(1 + \frac{2E_1}{E_2} \frac{1-2\sigma_2}{1+\sigma_1}\right). \quad (11)$$

Card 3/5

21971

S/020/61/137/005/014/026
B104/B214

The influence of elastic-relaxation ...

holds. If $0 > \nu > -1$ then it holds $\dot{R} < 0$ for the condition $R < R_0/(1 - |\nu|)$. Under these conditions (1) is fulfilled and the growth of a crystal is determined by the relaxation of the elastic stresses. For $\nu < -1$, the increase of the elastic stresses limits the growth of the crystal. Then the following approximate result holds: $R \sim \exp(-t/\tau_1(\nu + 1))$. For $\nu \geq -1$, τ_0 is the characteristic time of growth. A generalization of the results obtained states that for $\nu < -1$, the time of the growth of the crystal is equal to $\tau_1(\nu + 1) + \tau_0$ and for $\nu > -1$ it is τ_0 . Since, according to Stark, τ_0 and τ_1 depend on the temperature, the rate of crystallization is also essentially temperature dependent. Finally, it is shown that the maximum rate of crystallization is reached at a certain degree of supercooling and that according to the above results, the relaxation processes of the elastic stress play an essential role and not the small rates of fluctuation during a weak supercooling, as was previously stated. There are 3 Soviet-bloc references.
